

PCD1.G2000-A20

E-Line S-Serie RIO 6UI, 2AO, 2TR

The S-Serie E-Line RIO modules are controlled via the RS-485 serial communication protocols S-Bus and Modbus for decentralised automation using industrial quality components. The data point mix is specifically designed for building automation applications.

The compact design according to DIN EN 60715 TH35 enables the use in electrical distribution boxes even in the most confined spaces. Installation and maintenance are facilitated by the local manual override for each output. Remote maintenance is also possible using the access to the manual override by the web interface in the Saia PCD® controller. Programming is very efficient and fast using a complete FBox library with web templates for S-Bus. Individual programs may directly access the data points via Registers and Flags, a complete documentation is available from this data sheet.

Features

- ▶ S-Bus protocol optimized for fast data exchange
- ▶ Modbus protocol for integration in multi-vendor installations*
- ▶ Local override operating level via web panel or buttons on the module
- ▶ Easy programming using the FBox library and web templates
- ▶ Industrial hardware in accordance with IEC EN 61131-2
- ▶ Pluggable terminal blocks
- ▶ Bridge connectors for power supply and communication
- ▶ Bus termination on board
- ▶ Configurable Bi-Color LEDs and labelling for I/Os

* By default the module is working in S-Bus Data Mode with Autobaud detection.
To configure Modbus the Windows based Application "E-LineApp" is required.

General technical data

Power supply

Supply voltage	24 VDC, -15/+20% max. incl. 5% ripple (in accordance with EN/IEC 61131-2)
Power consumption	1.2 ... 3 W
Power supply bridge	24 VDC, 5 A max., up to 40 modules

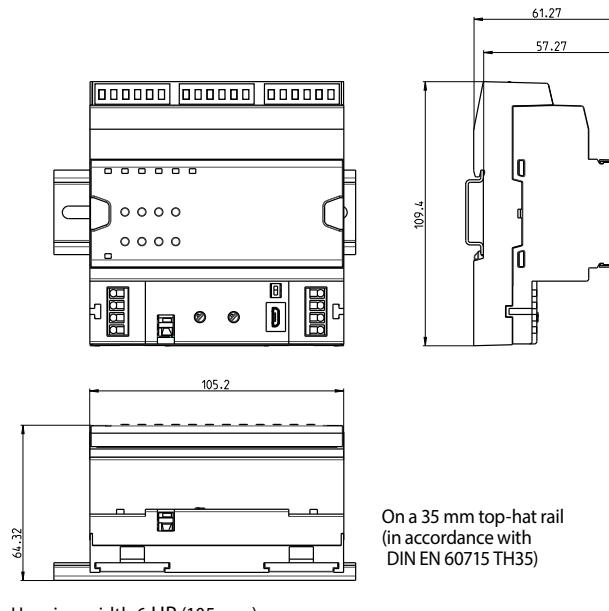

Interfaces

Communications interface	RS-485 Baud rate: 9,600, 19,200, 38,400, 57,600, 115,200 bps (Autobauding) Micro USB, Type B
Address switch	Two rotary switches 0 ... 9 Address range 0 ... 98
Bus termination	Integrated switch to activate and deactivate resistor termination

General data

Ambient temperature	Operation: 0 ... +55 °C Storage: -40 ... +70 °C
Protection class	IP 20
Package	Single carton package with 1 Module incl. terminal blocks, 1 bridge connector

Dimensions and installation

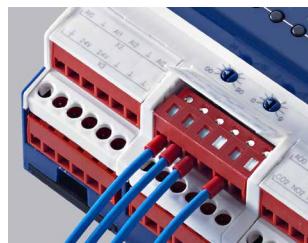

Housing width 6 HP (105 mm)
Compatible with electrical control cabinet
(in accordance with DIN 43880, size 2 × 55 mm)

On a 35 mm top-hat rail
(in accordance with
DIN EN 60715 TH35)

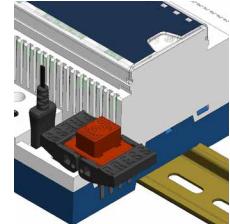

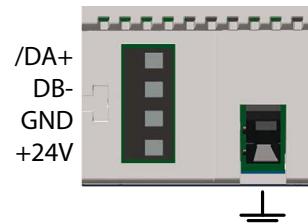

Terminal technology

Push-in spring terminals enable wiring with rigid or flexible wires with a diameter up to 1.5 mm². A max. of 1 mm² is permitted with cable end sleeves.

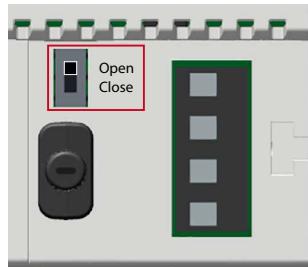

Connection concept

For easy installation the power supply and communication bus is available together at one connector. The push-in spring terminals enable wiring as well support the connector bridge.

Bus termination

The module provides an active bus termination. It is switched off by factory default. To enable the termination, the switch need to be in the "Close" position.

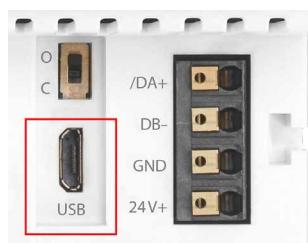

Status LED

OFF	No Power
Green	Communication OK
Green blink	Auto bauding in progress
Orange	No communication
Red	Error
Red/Green alternate	Booter mode (e.g. during Firmware download)
Red bink	Internal fatal error

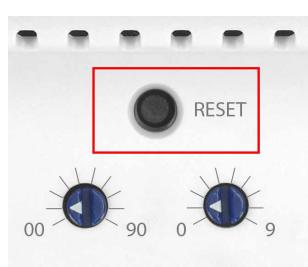

Service interface

The USB interface provides access to the Modbus configuration. Firmware updates can also be downloaded via Saia®PG5 Firmware Download tool.

Reset button

Pushed at power up: Module stays in Boot mode.
Pushed over 5 seconds: Reset to factory default.

Input/Output configuration

Universal Inputs

Number	6

Ni 1000	12	-50 ... +210 °C : 0.09 ... 0.11 °C Measuring current : 1.0 ... 1.3 mA	0.3% of measured value ± 0.5°C	-500 ... 2100
Ni 1000 L&S	12	-30 ... +140 °C : 0.12 ... 0.15 °C Measuring current : 1.0 ... 1.3 mA	0.3% of measured value ± 0.5°C	-300 ... 1400

[1] The PCD register outputs the value 0 ... 300 kΩ.

[2] Range 0 ... 300 kΩ must be used. The temperature for NTC are not standardised and may differ depending on the manufacturer.

A CSV file can be used for the value generation with a linearisation FBox. The CSV file can be found on the support page (link, see last page).

Digital input mode

Switching level	Low: <5V High: >10V
Input current	Max. 3.5mA

Analog output

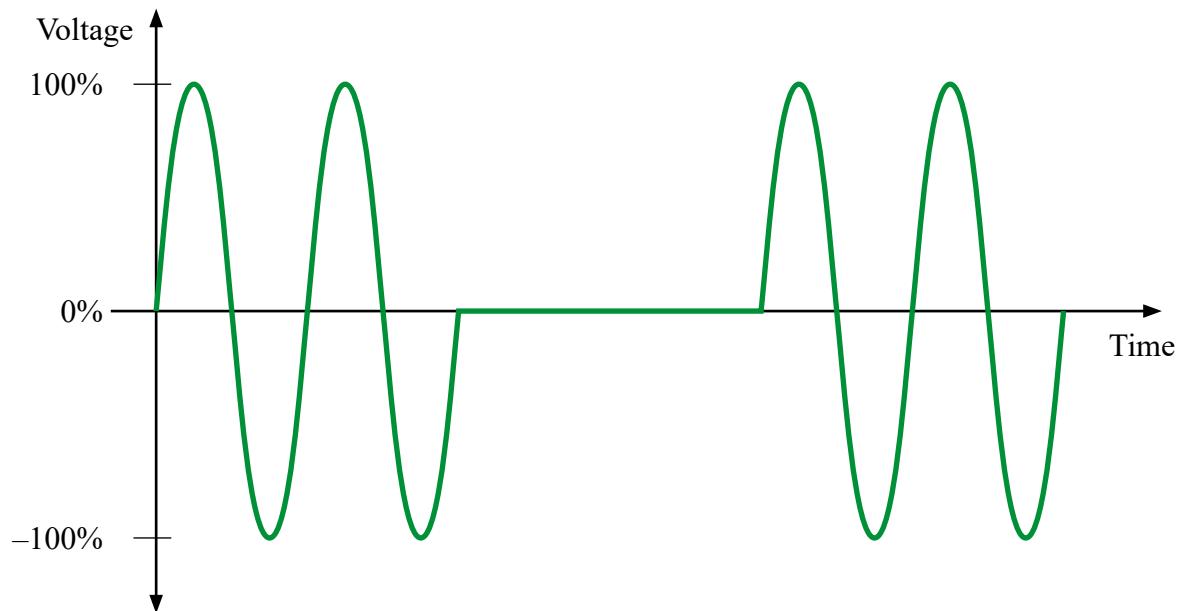

Number	2	
Resolution	10 bit	
Signal range	0 ... 10V	
Protection	Short-circuit protection	
Resolution	9.77 mV	
Max. load at output	3.3 kΩ (3.3 mA @ 10 V)	
Accuracy (at TAmbient = 25°C)	0.3% of the value ± 10 mV	
Residual ripple	< 15 mVpp	
Temperature error (0°C ... +55°C)	± 0.2%	
Output delay	Channel update Time constant of hardware output filter	1 ms (all channels are updated during this time) Voltage measurement $\tau = 2.5$ ms
Manual operation	Local override operation by buttons	

Input/Output configuration

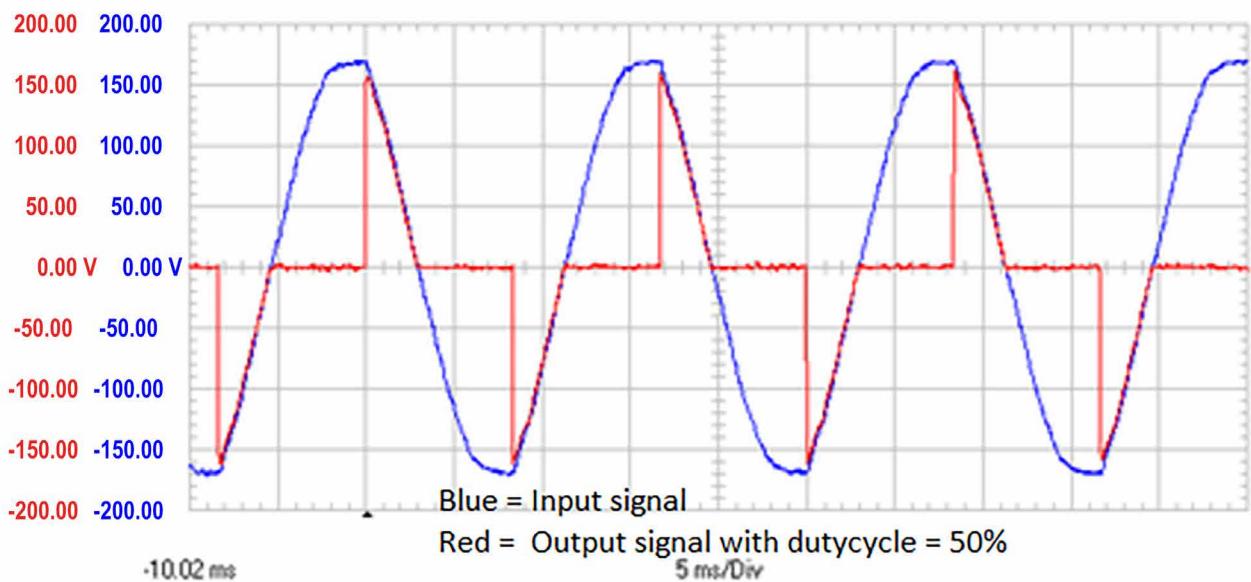

Triac output

Number	2
Switching voltage max.	24 VAC / 230 VAC
Switching current max	1 A (AC1, DC1)
Mode	Phase control (1) PWM (0) Time 1...600 s, standard 300 s
Manual operation	Local override operation by buttons

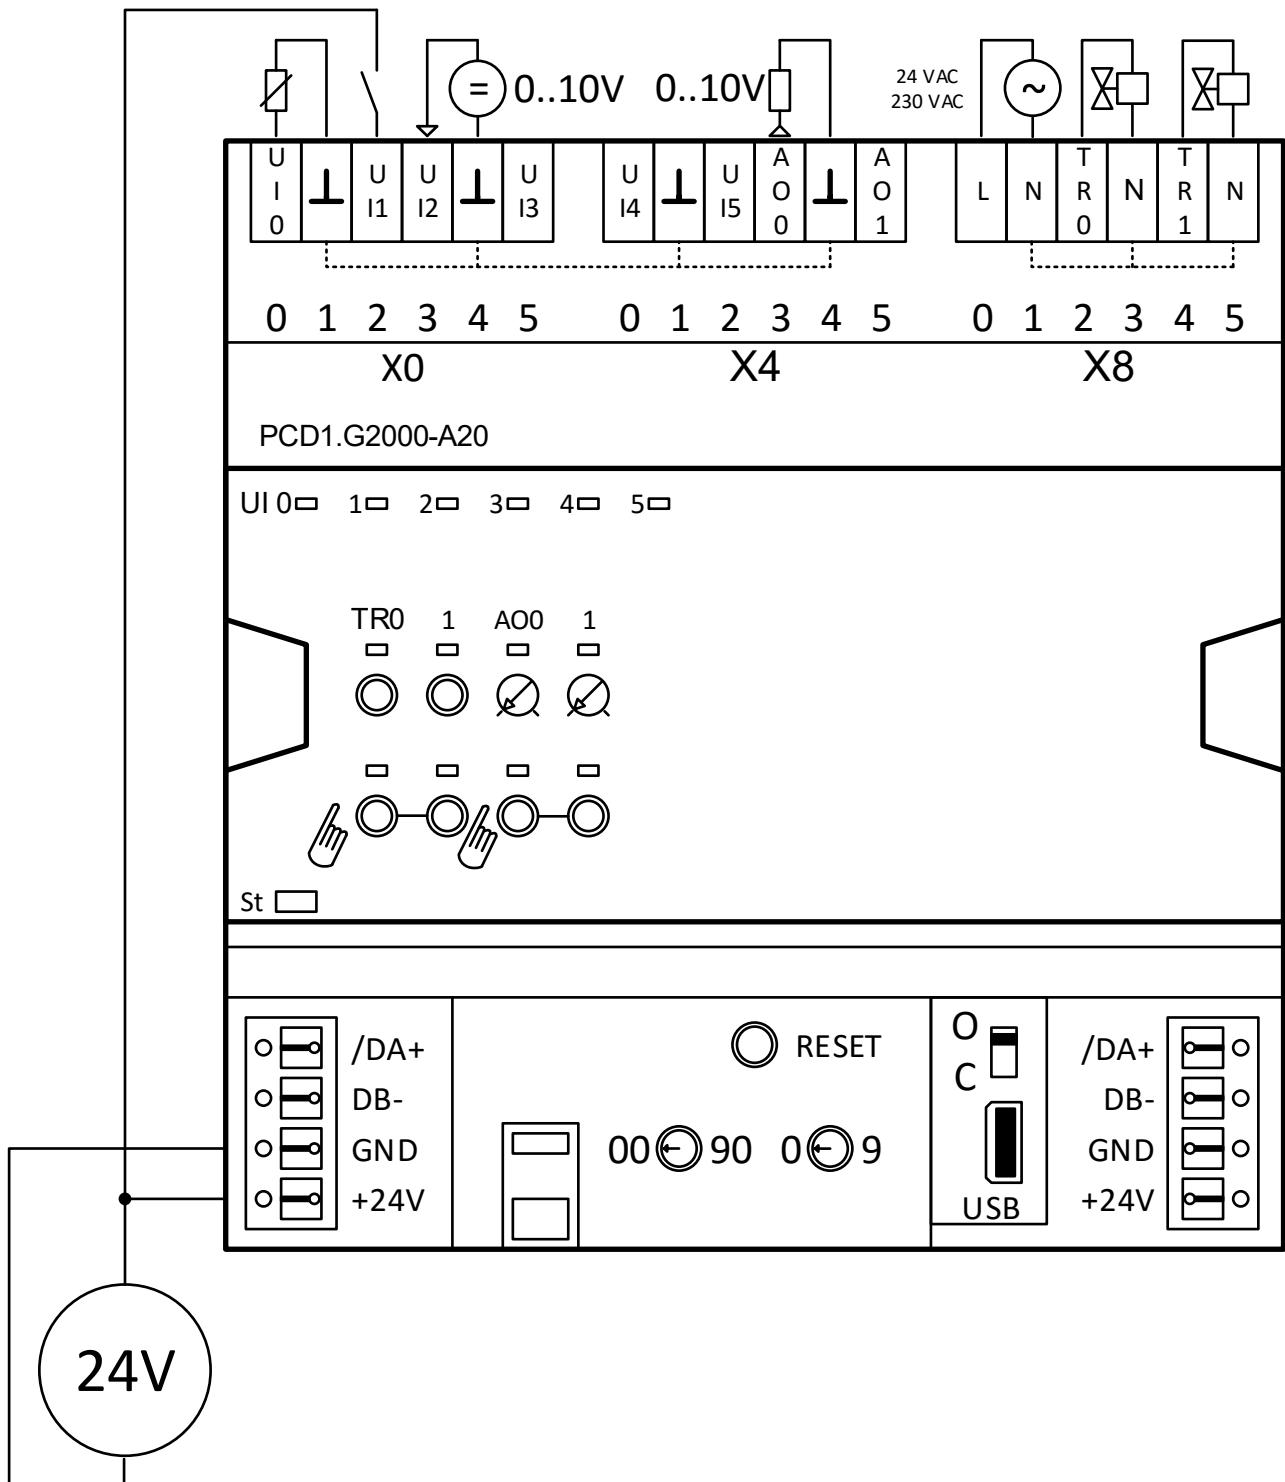

PWM of 50% duty cycle

Phase control with 50% duty cycle

Analogue output	-	0 ... 325 mV	0.325 ... 10 V	-
Triac output	-	0%	100%	-

* To avoid error indication (blinking LED), unused inputs should be configured in voltage range (default).

Status LED

OFF	No Power
Green	Communication OK
Green blink	Auto bauding in progress
Orange	No communication
Red	Error
Red/Green alternate	Booter mode (e.g. during Firmware download)
Red bink	Internal fatal error

Input / output

The indication LED can be configured in color and blink code separately for output state Low and High.

LED colour

- ▶ Off
- ▶ Red
- ▶ Green*
- ▶ Orange (red + green)

LED blink code

- ▶ No blink*
- ▶ Slow blinking (0.5 flashes per second)
- ▶ Fast blinking (2 flashes per second)

*Factory default

Remarks: In case of error on analogue I/O (overflow), the LED will blink at 1Hz.

Manual mode

The Manual override LED is Off in automatic mode and orange in case of manual override is active.

LED color

- ▶ Off (automatic)
- ▶ Orange manual mode active

LED blink code

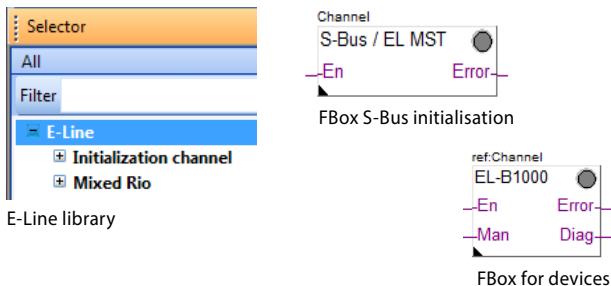

- ▶ No blink (local manual override)
- ▶ Blinking 1 flash per second (remote manual override)

Programming

The modules are addressed and programmed with Saia PG5® Fupla FBoxes. Web templates are available for the operation and visualisation of the manual override function.

Fupla

Communication FBox

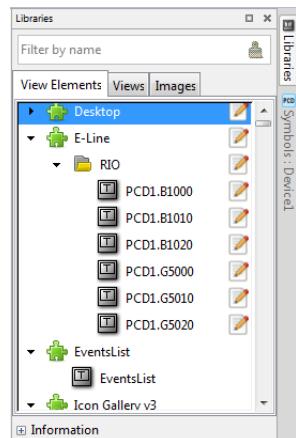

- ▶ Data exchange for I/O via optimised S-Bus
- ▶ Configurable save state for bus interruption or timeout
- ▶ Direct generation of the symbols
- ▶ Reading and writing of the status of the manual override status
- ▶ Direct compatibility with web macros

Further information, including which FBoxes are supported, Getting Started, etc., can be found on our support page www.saia-support.com

Web templates

Web templates are available for the operation and visualisation of the manual override function.

The inputs / outputs of the E-Line RIO modules can be addressed via the standard S-Bus. However the FBox from the E-Line library is used for the configuration of these modules. It is therefore recommended to use the optimised S-Bus protocol and the corresponding FBoxes from the E-Line library. Mixed mode operation is not recommended.

Manual operation

By using the local override function, commissioning can take place independently of the master station.

In addition, the manual operation can also be controlled remotely using a touch panel. If the bus line is cut off, the module keeps the manually set values. Traditional manual operation in the control cabinet door via potentiometers and switches can therefore be completely replaced by this solution.

Five operating modes can be selected for the manual operating function:

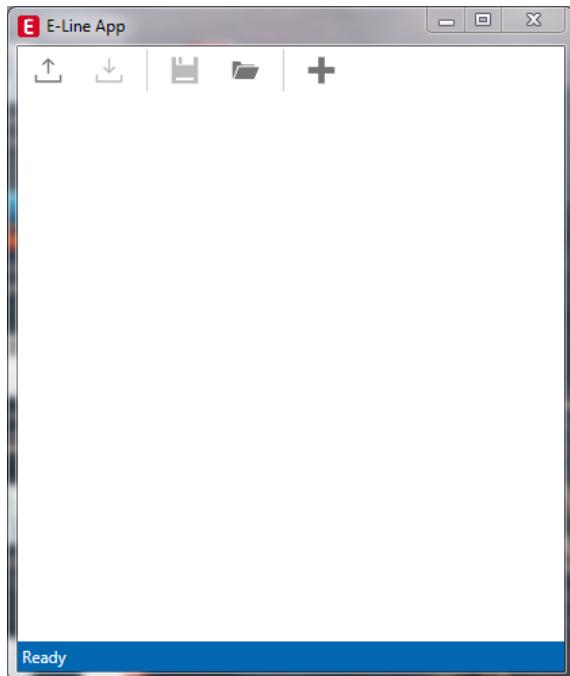

Operating modes	Description	Operation at the module	via remote (S-Bus)
1	Manual operation deactivated	✗	✗
2	Operation permitted from the module only	✓	✗
3	Operation permitted from the module and limited operation from the panel. If manual operation is activated at the module, it cannot be reset from the panel.	✓	(conditional)
4	Unlimited operation from the panel and module	✓	✓
5	Panel operation (remote)	✗	✓

Depending on the application, reset of manually set values is allowed from a panel. To address this requirement, it is possible to deactivate or limit manual operation function.

E-line App device setup

E-Line RIOs support the device setup by a windows application program connected via USB. The installer is available for download from the SBC support page: www.sbc-support.com → E-Line RIO IO Modules.

Create a new device configuration

Open an existing device configuration

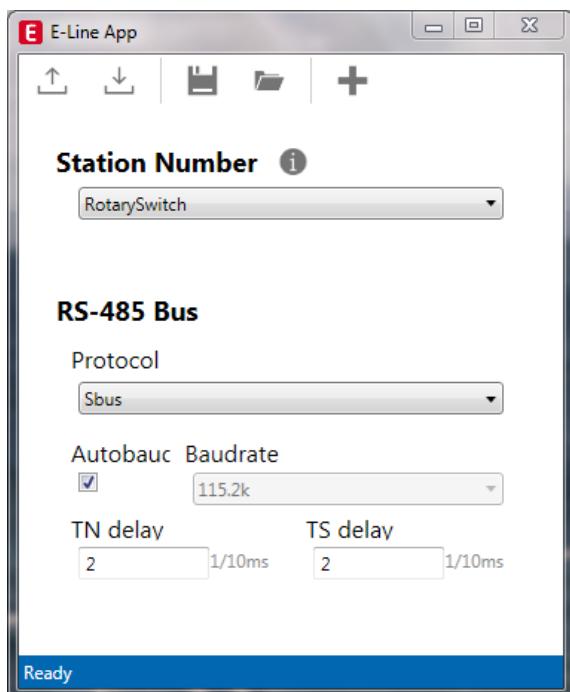

Save the current settings as device configuration

Upload configuration from the device

Download settings to the device

SBus settings

Autobaud	Baudrate
<input type="checkbox"/>	115.2k
TN delay	9.6k 19.2k 38.4k 57.6k 115.2k
2	

The station number can be set by the rotary switches at the device in the range of 0 ... 98. If the rotary switches are set to position 99 the station number can be defined by the device configuration in a range of 0 ... 253.

Station Number

RotarySwitch

The serial communication protocol can be defined either as SBus or Modbus. By default the modules are delivered from factory with SBus.

RS-485 Bus

Protocol

Sbus

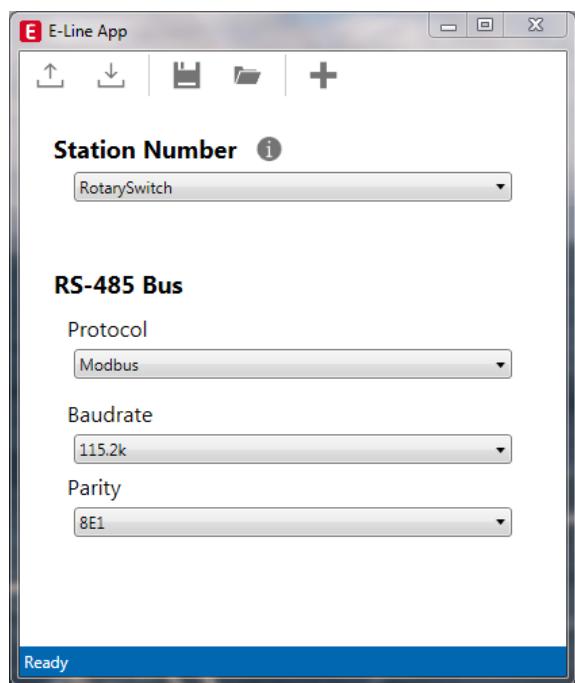

Sbus

Modbus

The Baudrate can be defined as automatic detection (default) or set to a specific value. The drop down choice will be available when the check box "Automatic" is unchecked. TN delay and TS delay shall be left at their default values of 2.

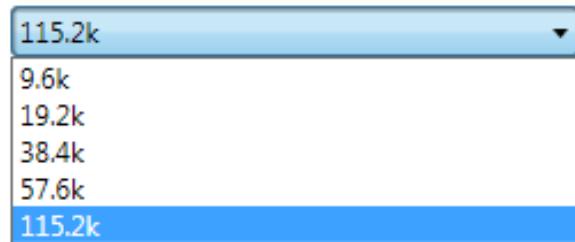

E-line App device setup

Modbus settings

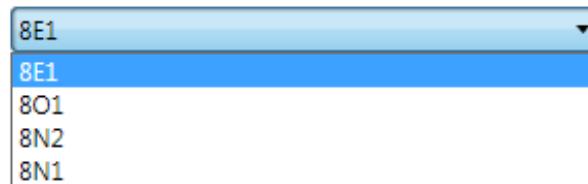

The Baudrate is set by default to 115k. It can be defined as choice of the list.

Baudrate

For best interoperability the Parity Mode and number of Stop Bits can also be set.

Parity

S-Bus communication

SBus communication is based on Saia PCD® SBus Data Mode. Only the set-up of a unique S-Bus address within the communication line is required to establish a communication between Saia PCD® controllers and E-Line RIO modules. The address can be set by the rotary switches at the front of module. The baud rate will be learned from the network by factory default. In addition a Windows based application is available for manual parameter setup. Configuration parameters as well as manual override state and value are saved non-volatile. A delay of about one second between a manual state change and none volatile saving has to be taken into consideration.

Device address

- 0 ... 98 Address is taken from the rotary switches
- 99 Address is taken from the device configuration. The address is settable with the E-Line configuration software.

Start-up procedure

- Reboot: All outputs are cleared (Off state)
- <1 sec. Output in manual operation are set according to the state before power down.
- Outputs in automatic mode

If no telegram received after reboot within the "safe state power-on timeout" the module enters as will into the safe state mode and sets the outputs according to their configured values.

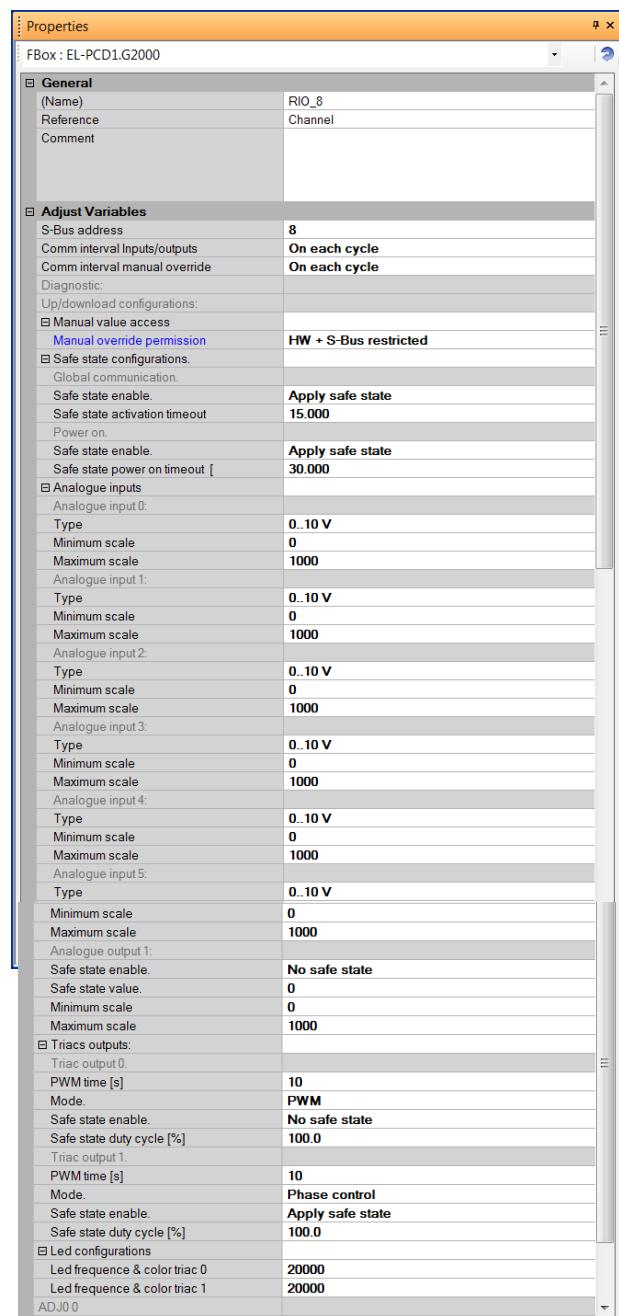

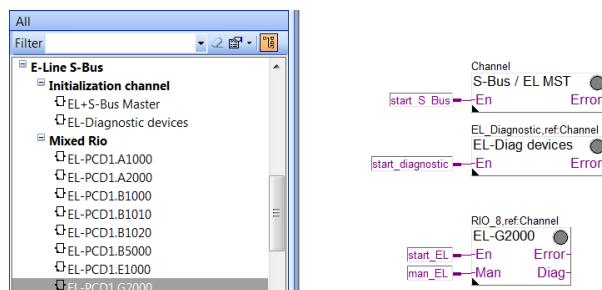

On reception of a valid command telegram the outputs are controlled by the communication. When no communication update followed within the "safe state com. timeout" the module enters into safe state and sets the outputs according to their configured values.

Usage of the E-Line module specific FBoxes

The usage of the E-Line module specific FBoxes from the E-Line S-Bus Fupla library allows an easy and efficient commissioning of the E-Line RIO.

The FBox allow to define and configure all possible functionalities of the E-Line RIO like manual override permission, usage of safe state mode, behaviour and colour of the LED's and so on.

In the background, the FBox does use the fast 'E-Line S-Bus' protocol for a high speed communication between the master and the RIO.

S-Bus communication

Direct access to the RIO medias with standard S-Bus send and receive telegrams

The following chapter describes the media and parameter mapping to Registers and Flags for individual programming. For efficient PCD programming the E-Line RIO FBox family and templates are suitable for most applications. Only individual programming (e.g. Instruction List) require standard SBUS communication.

Universal inputs

Input	Input Value	Read/Write	Mode	Range Min	Range Max	Read/Write
Analogue Input 0	Register 0	R	Register 360	Register 380	Register 400	RW
Analogue Input 1	Register 1	R	Register 361	Register 381	Register 401	RW
Analogue Input 2	Register 2	R	Register 362	Register 382	Register 402	RW
Analogue Input 3	Register 3	R	Register 363	Register 383	Register 403	RW
Analogue Input 4	Register 4	R	Register 364	Register 384	Register 404	RW
Analogue Input 5	Register 5	R	Register 365	Register 385	Register 405	RW

Mode Configuration Register:

0 : 0 ... 10 V (default)	Value scaled within Range Min and Range Max
3 : 0 ... 2500 Ω	Value scaled within Range Min and Range Max
4 : Pt1000	Value in 1/10°C (23.4 °C → 234)
5 : Ni1000	Value in 1/10°C (23.4 °C → 234)
6 : Ni1000LS	Value in 1/10°C (23.4 °C → 234)
8 : 0 ... 300 kΩ	Value scaled within Range Min and Range Max
9 : Digital input	Value for Input open, <5 V = 0, Input >10 V, 24 VDC = 1

Status	Status Value	Read/Write
Status AI0 ... AI3	Register 6	R
Status AI4 ... AI5	Register 6	R

Register format:
1 byte for each analogue input status.
(e.g. byte 0: AI0
byte 1: AI1
byte 2: AI2
byte 3: AI3)

Bit 0 Analogue input over-range
Bit 1 Analogue input under-range
Status is cleared when the input returns to normal state

Analogue Outputs

Output	Output Value	Read/Write	Manual override Communication	Read/Write [1]	Manual override Local	Read/Write [2]
Analogue output 0	Register 50	RW	Register 90	RW	Register 94	RW
Analogue output 1	Register 51	RW	Register 91	RW	Register 95	RW

[1] Writable only if SBUS permission is set in the configuration, otherwise write has no effect

[2] Writing to these registers has no effect. Used only if hardware permission is set in the configuration

Normal operation: The outputs are set according the flag set by the communication.

Manual operation: The output are set according to the manual command, the communication flags are ignored.

Safe State: In case of a broken communication, a safe state value can be applied, see table Safe State Configuration.

Register format for manual override via SBUS (Reg. 90 ... 91):

Bit 0 Current output value
Bit 30 1: output is driven in manual override by SBUS
Bit 31 1: output is driven in manual override by local push buttons

Register format for local manual override (Reg. 94 ... 95):

Bit 0 Current output value
Bit 31 1: output is driven in manual override by local push buttons

Output	Range Min	Range Max.	Read/Write*2
Analogue output 0	Register 440	Register 460	RW
Analogue output 1	Register 441	Register 461	RW

Output value 0...10 V == Register Value Range Min ... Range Max

S-Bus communication

Triac Outputs

Mode	Mode value	Read/Write
Mode triac 0	Register 500	RW
Mode triac 1	Register 501	RW

Mode:
PWM 0 (default)
Phase Control 1

Triac Outputs

Mode	Mode value	Read/Write	Manual override Communication	Read/Write [1]	Manual override Local	Read/Write [2]
Triac 0 status*	Register 30	RW	Register 92	RW	Register 96	RW
Triac 1 status*	Register 31	RW	Register 93	RW	Register 97	RW

* Register format: 0xnnnnmmmm (Hex): Status n == 0 Triac Off, n != 0 Triac On, m = elapsed time of PWM cycle in seconds

[1] Writable only if SBus permission is set in the configuration, otherwise write has no effect

[2] Writing to these registers has no effect. Used only if hardware permission is set in the configuration

Normal operation: The outputs are set according the flag set by the communication.

Manual operation: The output are set according to the manual command, the communication flags are ignored.

Safe State: In case of a broken communication, a safe state value can be applied, see table Safe State Configuration.

Register format for manual override via SBus (Reg. 92 ... 93):

Bit 0 Current output value
 Bit 30 1: output is driven in manual override by SBus
 Bit 31 1: output is driven in manual override by local push buttons

Register format for local manual override (Reg. 96 ... 97):

Bit 0 Current output value
 Bit 31 1: output is driven in manual override by local push buttons

Duty cycle	Duty cycle Value	Read/Write
Triac 0 duty cycle	Register 70	RW
Triac 1 duty cycle	Register 71	RW
Period	Period Value	Read/Write
Triac 0 period	Register 520	RW
Triac 1 period	Register 521	RW

Duty cycle in % with one fix decimal place 0 ... 100% = Register value 0 ... 1000.

PWM: The Triac will be activated at the beginning of a new cycle for a time of Triac period [s] * duty cycle [%]

Phase control: The Triac will be started every half wave for a duty cycle percentage of 10 ms.

PWM period in seconds, valid values 1 ... 600, factory default 30 seconds.

S-Bus communication

Configuration for safe state and manual override

Output	Safe State Enable	Read/Write	Safe State Value	Read/Write
Analogue Output 0	Flag 320	RW	Register 420	RW
Analogue Output 1	Flag 301	RW	Register 421	RW
Triac Output 0	Flag 380	RW	Register 480*	RW
Triac Output 1	Flag 381	RW	Register 481*	RW
Communication safe state enable default 0 (disabled)			Flag 400	RW
Power-On safe state enable default 0 (disabled)			Flag 401	RW
Power-On safe state timeout [ms], Valid values 1000 ... 100.000.000, default 30.000			Register 590	RW
Communication safe state timeout [ms] Valid values 1000 ... 100.000.000, default 15.000			Register 591	RW
Manual operation mode Bit 0: Disabled Bit 1: Remote control limited**, default 1 Bit 2: Local operation enabled, default 1 Bit 3: Remote control unlimited**, default 0 Bits can be combined to enable remote and local operation			Register 592	RW
* Duty cycle in % 0..100% = Register value 0...1000				
** If manual operation is locally activated at the module, the output value and manual state cannot be set/reset remotely				

Manual operation mode:

- ▶ Disabled (0)
- ▶ Local operation only (4, Bit 2 set)
- ▶ Local operation enabled, remote limited (6, Bit 1 and 2 set), default
- ▶ Local and remote operation enabled (12, Bit 2 and 3 set)
- ▶ Remote operation only, local operation disabled (8, Bit 3 set)

The safe state enable flag and the safe state value are combined in the following way:

Setting the enable flag to 0 keep the output value unchanged in case of safe state occurrence.

Setting the enable flag to 1 writes the safe state value in case of safe state occurrence.

Device Information

Firmware version (Decimal xyyzz, 10802 → 1.08.02)	Register 600	R
Number of supported registers	Register 601	R
Number of supported flags	Register 602	R
Product type (ASCII String)*3	Register 605 ... 608	R
Hardware version (Hex)	Register 609	R
Serial number (Hex)	Register 611 ... 612	R

Communication module address	Register 626	R
*1 Time in 0.1 ms (e.g. 2 means 200 us) before setting activation of RS-485 line driver send mode (only used for SBus slave protocol) *2 Time in 0.1 ms (e.g. 2 means 200 us) before sending the first character after line driver activation (only used for SBus slave protocol) *3 The four registers contain the ASCII characters of the product type. E.g. for PCD1.G2000-A20: 0605: 50434431H 0606: 2E413230H 0607: 30302D41H 0608: 32300000H		

Modbus communication

Modbus fulfils the requirements for standard communication protocols. It is based on Modbus RTU. The Windows based configuration software is required to enable and set up the Modbus communication parameters. The device address can be set up with the rotary switches at the front of the modules. Configuration parameters as well as manual override state and value are saved non-volatile. A delay of about one second between a manual state change and non-volatile saving has to be taken into consideration.

Device address

- ▶ 0 ... 98 Address is taken from the rotary switches
- ▶ 99 Address is taken from the device configuration. The address is settable with the E-Line configuration software.

Start-up procedure

- ▶ Reboot: All outputs are cleared (Off state)
- ▶ <1 sec. Output in manual operation are set according to the state before power down.
- ▶ Outputs in automatic mode
 - Is no telegram received after reboot within the "safe state power-on timeout" the module enters as will into the safe state mode and sets the outputs according to their configured values.
 - On reception of a valid command telegram the outputs are controlled by the communication. When no communication update followed within the "safe state com. timeout" the module enters into safe state and sets the outputs according to their configured values.

The following chapter describes the media and parameter mapping to Registers and Flags (=Coils).

Supported Modbus services:

- ▶ Function code 1 (read coils)
- ▶ Function code 3 (read registers)
- ▶ Function code 15 (write multiple coils)
- ▶ Function code 16 (write multiple registers)

Read coils

Request							
Address	Function	Start Address		Number of Coils to read		CRC	
0 ... 254	1	High-Byte	Low-Byte	High-Byte	Low-Byte	High-Byte	Low-Byte

Reply

Reply							
Address	Function	No. of Byte		Register Start Addr + 0		CRC	
0 ... 254	3	0 ... 256	High-Byte	Low-Byte	High-Byte	Low-Byte	High-Byte

Write register

Request							
Address	Function	Start Address		No. of Bytes	Data Words		CRC
0 ... 254	3	High-Byte	Low-Byte	0 ... 256	Low-Byte	High-Byte	High-Byte

Reply

Reply							
Address	Function	Start Address		No of Registers written		CRC	
0 ... 254	3	High-Byte	Low-Byte	High-Byte	Low-Byte	High-Byte	Low-Byte

The CRC has to be calculated over all telegram bytes starting with address field up to the last data byte. The CRC has to be attached to the data. Please find an example at the appendix of this document. For more details, please refer the publicly available Modbus documentation www.modbus.org.

Modbus communication

Analogue Input 2	Register 4-5	R	Register 724-725	Register 764-765	Register 804-805	RW
Analogue Input 3	Register 6-7	R	Register 726-727	Register 766-767	Register 806-807	RW
Analogue Input 4	Register 8-9	R	Register 728-729	Register 768-769	Register 808-809	RW
Analogue Input 5	Register 10-11	R	Register 730-731	Register 770-771	Register 810-811	RW

Mode Configuration Register:

0 : 0 ... 10 V (default)	Value scaled within Range Min and Range Max
3 : 0 ... 2500 Ω	Value scaled within Range Min and Range Max
4 : Pt1000	Value in 1/10°C (23.4 °C → 234)
5 : Ni1000	Value in 1/10°C (23.4 °C → 234)
6 : Ni1000LS	Value in 1/10°C (23.4 °C → 234)
8 : 0 ... 300 kΩ	Value scaled within Range Min and Range Max
9 : Digital input	Value for Input open, <5 V = 0, Input >10 V, 24 VDC = 1

Status	Status Value	Read/Write
Status AI0 ... AI3	Register 12-13	R
Status AI4 ... AI5	Register 14-15	R

Register format:
1 byte for each analogue input status.
(e.g. byte 0: AI0
byte 1: AI1
byte 2: AI2
byte 3: AI3)

Bit 0 Analogue input over-range
Bit 1 Analogue input under-range
Status is cleared when the input has again a correct value.

Analogue Outputs

Output	Output Value	Read/Write	Manual override Communication	Read/Write [1]	Manual override Local	Read/Write [2]
Analogue output 0	Register 100-101	RW	Value Reg. 180 Enable Reg. 181	RW	Value Reg. 188 Enable Reg. 189	RW
Analogue output 1	Register 102-103	RW	Value Reg. 182 Enable Reg. 183	RW	Value Reg. 190 Enable Reg. 191	RW

[1] Writable only if SBus permission is set in the configuration, otherwise write has no effect

[2] Writing to these registers has no effect. Used only if hardware permission is set in the configuration

Normal operation: The outputs are set according the flag set by the communication.

Manual operation: The output are set according to the manual command, the communication flags are ignored.

Safe State: In case of a broken communication, a safe state value can be applied, see table Safe State Configuration.

Register format for manual override via Modbus (Reg. 180 ... 183):

Bit 0 Current output value

Enable Reg. Bit 14 1: output is driven in manual override by Modbus

Enable Reg. Bit 15 1: output is driven in manual override by local push buttons

Register format for local manual override (Reg. 188 ... 191):

Value Reg. Bit 0 Current output value

Enable Reg. Bit 15 1: output is driven in manual override by local push buttons

Output	Range Min	Range Max.	Read/Write*2
Analogue output 0	Register 880-881	Register 920-921	RW
Analogue output 1	Register 882-883	Register 922-923	RW

Output value 0...10 V == Register Value Range Min ... Range Max

Modbus communication

Triac Outputs

Mode	Mode value	Read/Write
Mode triac 0	Register 1000-1001	RW
Mode triac 1	Register 1002-1003	RW

Mode:
 PWM 0 (default)
 Phase Control 1

Triac Outputs

Mode	Mode value	Read/Write	Manual override Communication	Read/Write [1]	Manual override Local	Read/Write [2]
Triac 0 status*	Register 30-31	RW	Value Reg. 184 Enable Reg. 185	RW	Value Reg. 192 Enable Reg. 193	RW
Triac 1 status*	Register 32-33	RW	Value Reg. 186 Enable Reg. 187	RW	Value Reg. 194 Enable Reg. 195	RW

* Register format 30-31, 32-33: Oxnnnnmmmm (Hex): Status n == 0 Triac Off, n != 0 Triac On, m = elapsed time of PWM cycle in seconds

[1] Writable only if SBus permission is set in the configuration, otherwise write has no effect

[2] Writing to these registers has no effect. Used only if hardware permission is set in the configuration

Normal operation: The outputs are set according the flag set by the communication.

Manual operation: The output are set according to the manual command, the communication flags are ignored.

Safe State: In case of a broken communication, a safe state value can be applied, see table Safe State Configuration.

Register format for manual override via Modbus (Reg. 184 ... 187):

Bit 0 Current output value

Enable Reg. Bit 14 1: output is driven in manual override by Modbus

Enable Reg. Bit 15 1: output is driven in manual override by local push buttons

Register format for local manual override (Reg. 192 ... 195):

Value Reg. Bit 0 Current output value

Enable Reg. Bit 15 1: output is driven in manual override by local push buttons

Duty cycle	Duty cycle Value	Read/Write
Triac 0 duty cycle	Register 140-141	RW
Triac 1 duty cycle	Register 142-143	RW
Period	Period Value	Read/Write
Triac 0 period	Register 1040-1041	RW
Triac 1 period	Register 1042-1043	RW

Duty cycle in % with one fix decimal place 0 ... 100% = Register value 0 ... 1000.

PWM: The Triac will be activated at the beginning of a new cycle for a time of Triac period [s] * duty cycle [%]

Phase control: The Triac will be started every half wave for a duty cycle percentage of 10 ms.

PWM period in seconds, valid values 1 ... 600, factory default 30 seconds.

Modbus communication

Configuration for safe state and manual override

Output	Safe State Enable	Read/Write	Safe State Value	Read/Write
Analogue Output 0	Flag 300	RW	Register 420	RW
Analogue Output 1	Flag 301	RW	Register 421	RW
Triac Output 0	Flag 380	RW	Register 480*	RW
Triac Output 1	Flag 381	RW	Register 481*	RW
Communication safe state enable default 0 (disabled)			Flag 400	RW
Power-On safe state enable default 0 (disabled)			Flag 401	RW
Power-On safe state timeout [ms], Valid values 1000 ... 100.000.000, default 30.000			Reg. 1180, 1181	RW
Communication safe state timeout [ms] Valid values 1000 ... 100.000.000, default 15.000			Reg. 1182, 1183	RW
Manual operation mode Bit 0: Disabled Bit 1: Remote control limited*, default 1 Bit 2: Local operation enabled, default 1 Bit 3: Remote control unlimited*, default 0 Bits can be combined to enable remote and local operation			Register 1184	RW
* Duty cycle in % 0..100% = Register value 0...1000 ** If manual operation is locally activated at the module, the output value and manual state cannot be set/reset remotely				

Manual operation mode:

- ▶ Disabled (0)
- ▶ Local operation only (4, Bit 2 set)
- ▶ Local operation enabled, remote limited (6, Bit 1 and 2 set), default
- ▶ Local and remote operation enabled (12, Bit 2 and 3 set)
- ▶ Remote operation only, local operation disabled (8, Bit 3 set)

The safe state enable flag and the safe state value are combined in the following way:

Setting the enable flag to 0 keep the output value unchanged in case of safe state occurrence.

Setting the enable flag to 1 writes the safe state value in case of safe state occurrence.

Device Information

Firmware version (Decimal xyyzz, 10802 → 1.08.02)	Register 1200	R
Number of supported registers	Register 1202	R
Number of supported flags	Register 1204	R
Product type (ASCII String)*3	Register 1210 ... 1217	R
Hardware version (Hex)	Register 1218	R
Serial number (Hex)	Register 1222 ... 1224	R
Communication protocol (1: SBus Slave, 3: Modbus)	Register 1240	R
Communication baud rate	Register 1242	R
Communication auto baud enable (0:disabled, 1:enabled)	Register 1244	R
Communication Mode 0: 8,E,1; 1: 8,O,1; 2: 8,N,2; 3: 8,N,1	Register 1250	R
Communication module address	Register 1252	R

*1 The eight registers contain the ASCII characters of the product type.

E.g. for PCD1.A2000-A20:

1210...1217: 5043H | 4431H | 2E41H | 3230H | 3030H | 2D41H | 3230H | 0000H

Modbus communication

CRC Generation Example

(Source: http://modbus.org/docs/PI_MBUS_300.pdf, the following content of this page is copied from the referenced document. In case of any questions, please check out the original source)

The function takes two arguments: `unsigned char *puchMsg`; A pointer to the message buffer containing binary data to be used for generating the CRC `unsigned short usDataLen`; The quantity of bytes in the message buffer. The function returns the CRC as a type `unsigned short`.

CRC Generation Function

```

unsigned short CRC16(puchMsg, usDataLen) ;
unsigned char *puchMsg ;                                /* message to calculate CRC upon */
unsigned short usDataLen ;                            /* quantity of bytes in message */
{
    unsigned char uchCRCHi = 0xFF ;                    /* high byte of CRC initialized */
    unsigned char uchCRCLo = 0xFF ;                    /* low byte of CRC initialized */
    unsigned uIndex ;                                 /* will index into CRC lookup table */
    while (usDataLen--)                                /* pass through message buffer */
    {
        uIndex = uchCRCHi ^ *puchMsg++;           /* calculate the CRC */
        uchCRCHi = uchCRCLo ^ auchCRCHi[uIndex];
        uchCRCLo = auchCRCLo[uIndex];
    }
    return (uchCRCHi << 8 | uchCRCLo);
}

```

High-Order Byte Table

Low-Order Byte Table

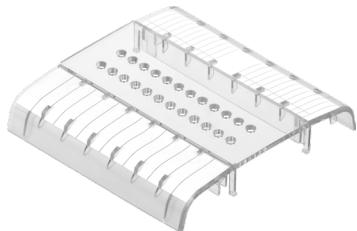

```

/* Table of CRC values for low-order byte */
static char auchCRCLo[] = {
